

The Manmade Global Warming Challenge

by Bob Tisdale

This report is a non-technical (no equations) but thoroughly understandable description of how ocean temperatures and ocean heat content have changed over the past decades.

If you want lessons in how Earth's water temperatures have changed, and whether or not you believe that humans and the increasing atmospheric <CO2> has had a significant role, then going through actual data in the methodology used by Bob Tisdale will teach some intriguing and interesting answers.

This is highly recommended.
